$$\bar{R}_{\theta} = \sum_{h} P(h) \sum_{x} R(h, x) P_{\theta}(x|h) \approx \frac{1}{N} \sum_{i=1}^{N} R(h^{i}, x^{i})$$

$$= \sum_{h} P(h) \sum_{x} R(h, x) P_{\theta}(x|h) \frac{\overline{VP}_{\theta}(x|h)}{P_{\theta}(x|h)}$$
Sampling

$$= E_{h \sim P(h), x \sim P_{\theta}(x|h)} [R(h, x) \overline{VlogP}_{\theta}(x|h)]$$

### Policy Gradient

Gradient Ascent

$$\theta^{new} \leftarrow \theta^{old} + \eta \nabla \bar{R}_{\theta^{old}}$$
$$\nabla \bar{R}_{\theta} \approx \frac{1}{N} \sum_{i=1}^{N} R(h^{i}, x^{i}) \nabla log P_{\theta}(x^{i} | h^{i})$$

 $R(h^{i}, x^{i}) \text{ is positive}$   $After updating \theta, P_{\theta}(x^{i}|h^{i}) \text{ will increase}$   $R(h^{i}, x^{i}) \text{ is negative}$   $After updating \theta, P_{\theta}(x^{i}|h^{i}) \text{ will decrease}$ 

### Policy Gradient - Implemenation

$$\theta^{t+1} \leftarrow \theta^t + \eta \nabla \overline{R}_{\theta^t}$$

$$\frac{1}{N} \sum_{i=1}^N R(c^i, x^i) \nabla \log P_{\theta^t}(x^i | c^i)$$

$$R(c^i, x^i) \text{ is positive}$$

$$\text{Updating } \theta \text{ to increase } P_{\theta}(x^i | c^i)$$

$$R(c^i, x^i) \text{ is negative}$$

$$\text{Updating } \theta \text{ to decrease } P_{\theta}(x^i | c^i)$$

### Conditional GAN

# Algorithm

Training data:

Pairs of conditional input c and response x

- Initialize generator G (chatbot) and discriminator D
- In each iteration:
  - Sample input c and response x from training set
  - Sample input c' from training set, and generate response  $\tilde{x}$  by G(c')
  - Update D to increase D(c, x) and decrease  $D(c', \tilde{x})$

## Reinforcement Learning?

- Consider the output of discriminator as reward
  - Update generator to increase discriminator = to get maximum reward
  - Using the formulation of policy gradient, replace reward R(c, x) with discriminator output D(c, x)
- Different from typical RL
  - The discriminator would update

# Reward for Every Generation Step $\nabla \overline{R}_{\theta} \approx \frac{1}{N} \sum_{i=1}^{N} D(c^{i}, x^{i}) \nabla log P_{\theta}(x^{i} | c^{i})$

 $c^{i} = \text{``What is your name?''} \quad D(c^{i}, x^{i}) \text{ is negative}$   $x^{i} = \text{``I don't know''} \quad Update \ \theta \text{ to decrease } \log P_{\theta}(x^{i}|c^{i})$   $log P_{\theta}(x^{i}|c^{i}) = log P(x_{1}^{i}|c^{i}) + log P(x_{2}^{i}|c^{i}, x_{1}^{i}) + log P(x_{3}^{i}|c^{i}, x_{1:2}^{i})$   $P(\text{``I''}|c^{i}) = P(x_{1}^{i}|c^{i}) + log P(x_{2}^{i}|c^{i}, x_{1}^{i}) + log P(x_{3}^{i}|c^{i}, x_{1:2}^{i})$

### Tips: RankGAN

Kevin Lin, Dianqi Li, Xiaodong He, Zhengyou Zhang, Ming-Ting Sun, "Adversarial Ranking for Language Generation", NIPS 2017

#### Image caption generation:

Method	BLEU-2	BLEU-3	BLEU-4	Method	Human score
MLE	0.781	0.624	0.589	SeqGAN	3.44
SeqGAN	0.815	0.636	0.587	RankGAN	4.61
RankGAN	<b>0.845</b>	<b>0.668</b>	<b>0.614</b>	Human-writte	n <b>6.42</b>

### **Experimental Results**

Input	We've got to look for another route.
MLE	l'm sorry.
GAN	You're not going to be here for a while.
Input	You can save him by talking.
MLE	I don't know.
GAN	You know what's going on in there, you know what I mean?

- MLE frequently generates "I'm sorry", "I don't know", etc. (corresponding to fuzzy images?)
- GAN generates longer and more complex responses (however, no strong evidence shows that they are better)

Find more comparison in the survey papers.

[Lu, et al., arXiv, 2018][Zhu, et al., arXiv, 2018]

### More Applications

- Supervised machine translation [Wu, et al., arXiv 2017][Yang, et al., arXiv 2017]
- Supervised abstractive summarization [Liu, et al., AAAI 2018]
- Image/video caption generation [Rakshith Shetty, et al., ICCV 2017][Liang, et al., arXiv 2017]

If you are using seq2seq models, consider to improve them by GAN.
