HMM in Speech Recognition

3

Speech Recognition

- In acoustic model,
 - each word consists of syllables
 - each syllable consists of phonemes
 - each phoneme consists of some (hypothetical) states.

"青色"→"青(<-∠)色(ムさ、)"→ "< "→ {S₁, S₂, ...}

Each phoneme can be described by a HMM (acoustic model). Given a sequence of observation (MFCC vectors), each of them can be mapped to a corresponding state.

Speech Recognition

- Hence, there are state transition probabilities (a_{ij}) and observation distribution (bj [ot]) in each phoneme acoustic model(HMM).
- Usually in speech recognition we restrict the HMM to be a left-to-right model, and the observation distribution are assumed to be a continuous Gaussian mixture model.

Review

- left-to-right
- observation distribution are a continuous
 Gaussian mixture model

2.0 Fundamentals of Speech Recognition

Hidden Markov Models (HMM)

$$B = [b_{j}(\overline{o}), j = 1, 2, ...N] \text{ observation probability} b_{j}(\overline{o}) = \sum_{k=1}^{M} c_{jk} b_{jk}(\overline{o})$$

 $b_{jk}(\bar{o})$: multi-variate Gaussian distribution

for the k-th mixture of the j-th state

$$M$$
: total number of mixtures

$$\sum_{k=1}^{n} c_{jk} = 1$$

$$\pi = [\pi_1, \pi_2, \dots \pi_N] \text{ initial probabilities}$$

$$\pi_i = \operatorname{Prob}[q_1 = i]$$

HMM : (A, B, π) = λ

General Discrete HMM

•
$$a_{ij} = P(q_{t+1} = j | q_t = i) \forall t, i, j$$
.
 $b_j(A) = P(o_t = A | q_t = j) \forall t, A, j$

Given q_t , the probability distributions of q_{t+1} and o_t are completely determined.

(independent of other states or observation)

HW1 v.s. Speech Recognition

	Homework #I	Speech Recognition		
λ set	5 Models	Initial-Final		
λ	model_01~05	" < "		
{ o _t }	A, B, C, D, E, F	39dim MFCC		
unit	an alphabet	a time frame		
observation	sequence	voice wave		

Homework of HMM

9

Problems of HMM

Training

- Basic Problem 3 in Lecture 4.0
 - Give O and an initial model $\lambda = (A, B, \pi)$, adjust λ to maximize $P(O|\lambda) = \pi_i = P(q_1 = i)$, $A_{ij} = a_{ij}$, $B_{jt} = b_j [o_t]$
- Baum-Welch algorithm

Testing

- Basic Problem 2 in Lecture 4.0
 - Given model λ and O, find the best state sequences to maximize $P(O|\lambda, q)$.
- Viterbi algorithm

Training

- Basic Problem 3:
 - Give O and an initial model $\lambda = (A, B, \pi)$, adjust λ to maximize $P(O|\lambda)$

$$\pi_i = P(q_1 = i), A_{ij} = a_{ij}, B_{jt} = b_j [o_t]$$

Baum-Welch algorithm

A generalized expectation-maximization (EM) algorithm.

- 1. Calculate α (forward probabilities) and β (backward probabilities) by the observations.
- 2. Find ϵ and γ from α and β
- 3. Recalculate parameters $\lambda' = (A', B', \pi')$

http://en.wikipedia.org/wiki/Baum-Welch_algorithm

Forward Procedure

+ Forward Procedure(Forward Algorithm): defining a forward variable $\alpha_t(i)$

 $\alpha_t(i) = P(o_1 o_2....o_t, q_t = i|\lambda)$

=Prob[observing $o_1 o_2 \dots o_t$, state i at time t $|\lambda|$]

- Initialization

 $\alpha_{\mathbf{1}}(\mathbf{i}) = \pi_{\mathbf{i}} \mathbf{b}_{\mathbf{i}}(\mathbf{o}_{\mathbf{1}}), \quad 1 \le \mathbf{i} \le \mathbf{N}$

- Induction

$$\begin{aligned} \alpha_{t+1}(j) &= \left[\sum_{i=1}^{N} \alpha_{t}(i)a_{ij}\right] b_{j}(o_{t+1}) \\ &1 \leq t \leq T-1 \\ &1 \leq j \leq N \end{aligned}$$

- Termination $P(\overline{O}|\lambda) = \sum_{i=1}^{N} \alpha_{T}(i)$

Forward Procedure by matrix

- Calculate β by backward procedure is similar.
- Backward Algorithm : defining a backward variable $\beta_t(i)$

 $\beta_t(i) = P(o_{t+1}, o_{t+2}, ..., o_T | q_t = i, \lambda)$

- = Prob[observing o_{t+1} , o_{t+2} ,..., o_T |state i at time t, λ]
- Initialization

 $\beta_{\mathbf{T}}(\mathbf{i}) = 1, \ 1 \le \mathbf{i} \le \mathbf{N}$

- Induction $\beta_{t}(i) = \sum_{j=1}^{N} a_{ij} b_{j}(o_{t+1})\beta_{t+1}(j)$ $t = T-1, T-2, \dots, 2, 1, \qquad 1 \le i \le N$ See Fig. 6.6 of Rabiner and Juang

Calculate y

- Define a new variable $\gamma_t(i) = P(q_t = i | O, \lambda)$

$$\gamma_{t}(i) = \frac{\alpha_{t}(i)\beta_{t}(i)}{\sum_{i=1}^{N} \alpha_{t}(i)\beta_{t}(i)} = \frac{P(O, q_{t}=i|\lambda)}{P(\overline{O}|\lambda)}$$

Should be a N×T matrix your code!

Calculate ε

The probability of transition from state *i* to state *j* given observation and model.

$$\begin{split} \boldsymbol{\epsilon}_{t}(i, j) &= P(q_{t} = i, q_{t+1} = j \mid \overline{O}, \lambda) \\ &= \frac{\alpha_{t}(i) a_{ij} b_{j}(o_{t+1})\beta_{t+1}(j)}{\sum_{i=1}^{N} \sum_{j=1}^{N} [\alpha_{t}(i)a_{ij} b_{j}(o_{t+1})\beta_{t+1}(j)]} \\ &= \frac{Prob[\overline{O}, q_{t} = i, q_{t+1} = j|\lambda]}{P(\overline{O}|\lambda)} \end{split}$$

Totally T - 1 matrices (Each N×N).

Accumulate ε and γ

- Recall $\gamma_t(i) = P(q_t = i \mid \overline{O}, \lambda)$

 $\sum_{t=1}^{T-1} \gamma_t(i) = \text{expected number of times that state i}$ is visited in Ofrom t = 1 to t = T-1

= expected number of transitions from state i in \overline{O}

Re-estimate Model Parameters $\lambda' = (A', B', \pi')$

 $\pi_i = \frac{\sum \gamma_1(i)}{N}$, where N is number of samples

 $a_{ij} = \frac{\sum \epsilon(i,j)}{\sum \gamma(i)} = \frac{E[\text{Number of Transition from i to }j]}{E[\text{Number of Visiting state }i]}$

 $b_{i}(k) = \frac{\sum_{0=k} \gamma(i)}{\sum \gamma(i)} = \frac{E[\text{Number of Observation } 0 = k \text{ in state } i]}{E[\text{Number of Visiting state } i]}$

Accumulate ε and γ through all samples!! Not just all observations in one sample!!

Testing

- Basic Problem 2:
 - Given model λ and O, find the best state sequences to maximize P(O|λ, q).
- Calculate $P(O|\lambda) \doteq \max P(O|\lambda, q)$ for each of the five models.
- The model with the highest probability for the most probable path usually also has the highest probability for all possible paths.

Viterbi Algorithm

Complete Procedure for Viterbi Algorithm

- Initialization

- Termination $P^* = \max \left[\delta_{-}(i) \right]$

 $\delta_{\mathbf{1}}(i) = \pi_{\mathbf{i}} b_{\mathbf{i}}(o_{\mathbf{1}}) , \ 1 \quad \leq i \leq N$

 $P^* = \max_{1 \le i \le N} [\delta_T(i)]$

- Recursion

 $\delta_{\mathbf{t}}(\mathbf{j}) = \max_{1 \le \mathbf{i} \le \mathbf{N}} \left[\delta_{\mathbf{t}-\mathbf{1}}(\mathbf{i}) a_{\mathbf{i}\mathbf{j}} \right] \bullet b_{\mathbf{j}}(\mathbf{o}_{\mathbf{t}})$

 $2 \le t \le T, 1 \le j \le N$

 $\delta_{t}(i) = \max_{q_{1},q_{2},...,q_{t-1}} P[q_{1},q_{2},...q_{t-1}, q_{t} = i, o_{1},o_{2},...,o_{t} |\lambda]$

= the highest probability along a certain single path ending at state i at time t for the first t observations, given λ

File Format

test_hmm.c

- An example of using hmm.h (include I/O functions) and Makefile (a script to compile your program).
- Type "make" to compile, type "make clean" to remove executable.
- Please use the hmm.h provided by TA.
- If C++11 is used, add the flag -std=c++11 in your makefile.

test_hmm.c

```
r98922053@linux12:~/hw1 $ cd c cpp/

Input and Output of your programs

- Training algorithm
 - input
 - number of iterations
 - initial model (model_init.txt)
 - observed sequences (seq_model_01~05.txt)
 - output
 - λ =(A, B, π) for 5 trained models
 - 5 files of parameters for 5 models (model_01~05.txt)

Testing algorithm

- input
 - modellist.txt (list of filename of models trained in the previous step)
 - Observed sequences (testing_data1.txt & testing_data2.txt)
- output
 - best answer labels and $P(O|\lambda)$ (result1.txt & result2.txt)

Program Format Example

./train iteration model_init.txt seq_model_01.txt model_01.txt

./test modellist.txt testing_data.txt result.txt

- Arguments are NOT fixed, read them during runtime.
 (i.e. Use argv in main function to pass the arguments.)
- The arguments need to be variable path (it is not necessary to be in the directory the program executed).
 (e.g. data path may be ~/data/testing_data.txt)

Input Files

- +- dsp_hw1/
 - +- c_cpp/
 - +-
 - +- modellist.txt //the list of models to be trained
 - +- model_init.txt //HMM initial models
 - +- seq_model_01~05.txt //training data observation
 - +- testing_data1.txt //testing data observation
 - +- testing_answer.txt //answer for "testing_data1.txt"
 - +- testing_data2.txt //testing data without answer

Observation Sequence Format

acc.txt

- Calculate the classification accuracy your models obtain on testing data1.
- Only the highest (submitted) accuracy!!!
- One line (number) only
- No need to submit the code for calculating accuracy.

Submit Requirement

- Upload to CEIBA
- Your program
 - train.c, test.c, hmm.h, Makefile
- Your 5 Models After Training
 model_01~05.txt
- Testing result and and accuracy
 - oresult1~2.txt (for testing_data1~2.txt)
 - acc.txt (for testing_data1.txt)
- Document (pdf) (No more than 2 pages)
 - Name, student ID, summary of your results
 - Specify your environment and how to execute.

Submit Requirement

Compress your hw1 into "hw1_[學號].zip"

After unzipping, it should be +- hw1 [學號]/

- +- train.c /.cpp
- +- test.c /.cpp
- +- hmm.h
- +- Makefile
- +- model_01~05.txt
- +- result1~2.txt
- +- acc.txt
- +- Document.pdf (pdf)

Remark

- Testing environment: CSIE workstation(gcc 8.2).
- ▶ If C++11 is used, add -std=c++11 in your makefile.
- You have to make sure your program is able to compile(hmm.h should be submitted).
- The arguments of your program have to be given in the runtime(provided by argv in main function).
- **Do not** compress the directory by **RAR/TAR**.
- The testing program should run in 10 minute.
- ► FAQ : <u>http://speech.ee.ntu.edu.tw/DSP2019Spring/hw1/FAQ.html</u>

Grading Policy

- Accuracy 30%
- Program 35%
- •Report 10%
 - Environment + how to execute + summary of your program.

•File Format 25%

- zip & fold name
- result1~2.txt
- model_01~05.txt
- acc.txt
- makefile
- Command line (train & test) (see page. 25)

You may get zero point in file format if the format is wrong.

Bonus 5%

• Impressive analysis in report.

Do Not Cheat!

- Any form of cheating, lying, or plagiarism will not be tolerated!
- We will compare your code with others.
 (including students who has enrolled this course)
