# What can we know from RREF? Hung-yi Lee

#### Reference

• Textbook: Chapter 1.6, 1.7

#### Outline

- RREF v.s. Linear Combination
- RREF v.s. Independent
- RREF v.s. Rank
- RREF v.s. Span

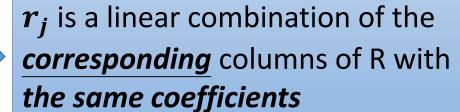

# RREF v.s. Linear Combination

#### Column Correspondence Theorem

RREF
$$A = \begin{bmatrix} a_1 & \cdots & a_n \end{bmatrix} \longrightarrow R = \begin{bmatrix} r_1 & \cdots & r_n \end{bmatrix}$$

If  $a_j$  is a linear combination of other columns of A

$$\mathbf{r}_5 = -\mathbf{r}_1 + \mathbf{r}_4$$

 $a_j$  is a linear combination of the corresponding columns of A with the same coefficients

$$a_3 = 3a_1 - 2a_2$$

If  $r_j$  is a linear combination of other columns of R

$$r_3 = 3r_1 - 2r_2$$

#### Column Correspondence Theorem - Example

$$A = \begin{bmatrix} 1 & 2 & -1 & 2 & 1 & 2 \\ -1 & -2 & 1 & 2 & 3 & 6 \\ 2 & 4 & -3 & 2 & 0 & 3 \\ -3 & -6 & 2 & 0 & 3 & 9 \end{bmatrix} \qquad R = \begin{bmatrix} 1 & 2 & 0 & 0 & -1 & -5 \\ 0 & 0 & 1 & 0 & 0 & -3 \\ 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

$$a_{2} = 2a_{1}$$
 $r_{2} = 2r_{1}$ 
 $a_{5} = -a_{1} + a_{4}$ 
 $r_{5} = -r_{1} + r_{4}$ 

#### Column Correspondence Theorem – Intuitive Idea

$$a_{1} + a_{2} = a_{3}$$

$$A = \begin{bmatrix} 6 & 9 & 15 \\ 8 & 0 & 8 \\ 9 & 2 & 11 \end{bmatrix}$$

$$A = \begin{bmatrix} 9 & 2 & 11 \\ 8 & 0 & 8 \\ 6 & 9 & 15 \end{bmatrix}$$

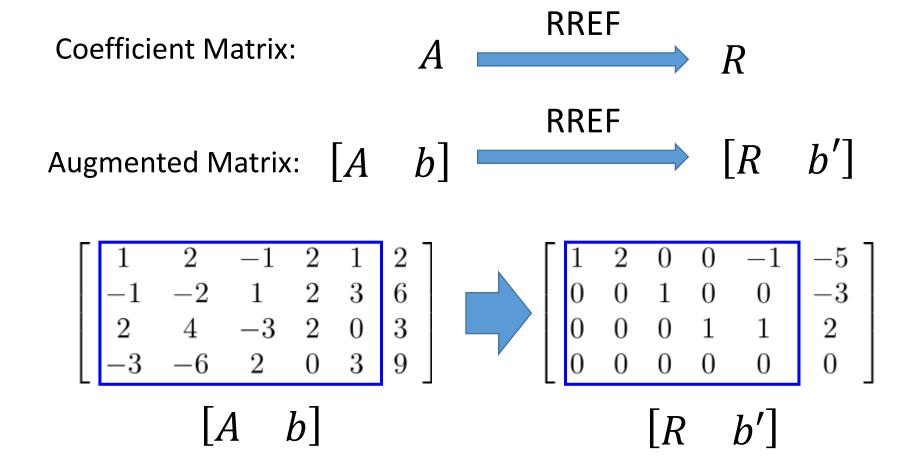

$$C_{1} + C_{2} = C_{3}$$

$$C = \begin{bmatrix} 12 & 18 & 30 \\ 8 & 0 & 8 \\ 9 & 2 & 11 \end{bmatrix}$$

$$C = \begin{bmatrix} 12 & 18 & 30 \\ 8 & 0 & 8 \\ 9 & 2 & 11 \end{bmatrix}$$

Column Correspondence Theorem (Column 間的承諾): 就算 row elementary operation 讓 column 變的不同, 他們之間的關係永遠不變。

• Before we start:

• The RREF of matrix A is R Ax = b and Rx = b have the same solution set?

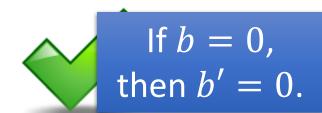

• The RREF of augmented matrix [A] Ax = b and Rx = b' havethe same solution set

The RREF of matrix A is R

Ax = 0 and Rx = 0 have the same solution set

• The RREF of matrix A is R, Ax = 0 and Rx = 0 have the same solution set

$$A = \begin{bmatrix} 1 & 2 & -1 & 2 & 1 & 2 \\ -1 & -2 & 1 & 2 & 3 & 6 \\ 2 & 4 & -3 & 2 & 0 & 3 \\ -3 & -6 & 2 & 0 & 3 & 9 \end{bmatrix} \quad R = \begin{bmatrix} 1 & 2 & 0 & 0 & -1 & -5 \\ 0 & 0 & 1 & 0 & 0 & -3 \\ 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

• The RREF of matrix A is R, Ax = 0 and Rx = 0 have the same solution set

$$A = \begin{bmatrix} 1 & 2 & -1 & 2 & 1 & 2 \\ -1 & -2 & 1 & 2 & 3 & 6 \\ 2 & 4 & -3 & 2 & 0 & 3 \\ -3 & -6 & 2 & 0 & 3 & 9 \end{bmatrix} \quad R = \begin{bmatrix} 1 & 2 & 0 & 0 & -1 & -5 \\ 0 & 0 & 1 & 0 & 0 & -3 \\ 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

$$\mathbf{a}_{5} = -\mathbf{a}_{1} + \mathbf{a}_{4}$$

$$\mathbf{a}_{1} - \mathbf{a}_{4} + \mathbf{a}_{5} = 0$$

$$x = \begin{bmatrix} 1 \\ 0 \\ 0 \\ -1 \\ 1 \\ 0 \end{bmatrix}$$

$$Rx = 0$$

$$x = \begin{bmatrix} 1 \\ 0 \\ 0 \\ -1 \\ 1 \\ 0 \end{bmatrix}$$

$$r_{5} = -\mathbf{r}_{1} + \mathbf{r}_{4}$$

$$r_{1} - \mathbf{r}_{4} + \mathbf{r}_{5} = 0$$

#### How about Rows?

Are there row correspondence theorem?

$$A = \begin{bmatrix} 1 & 2 & -1 & 2 & 1 & 2 \\ -1 & -2 & 1 & 2 & 3 & 6 \\ 2 & 4 & -3 & 2 & 0 & 3 \\ -3 & -6 & 2 & 0 & 3 & 9 \end{bmatrix} \quad R = \begin{bmatrix} 1 & 2 & 0 & 0 & -1 & -5 \\ 0 & 0 & 1 & 0 & 0 & -3 \\ 0 & 0 & 0 & 1 & 1 & 2 \\ 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

$$A = \begin{bmatrix} -a_1^T & & & & \\ -a_2^T & & & & \\ & & a_3^T & & \\ & & & & & \end{bmatrix} \quad R = \begin{bmatrix} -r_1^T & & & \\ -r_2^T & & & \\ & & & & \\ & & & & & \end{bmatrix}$$

$$Span\{a_1, a_2, a_3, a_4\} \quad = \quad Span\{r_1, r_2, r_3, r_4\}$$

Are they the same?

#### Span of Columns

$$A = \begin{bmatrix} 1 & 2 & -1 & 2 & 1 & 2 \\ -1 & -2 & 1 & 2 & 3 & 6 \\ 2 & 4 & -3 & 2 & 0 & 3 \\ -3 & -6 & 2 & 0 & 3 & 9 \end{bmatrix} \quad R = \begin{bmatrix} 1 & 2 & 0 & 0 & -1 & -5 \\ 0 & 0 & 1 & 0 & 0 & -3 \\ 0 & 0 & 0 & 1 & 1 & 2 \\ 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

$$A = \begin{bmatrix} a_1 & \cdots & a_6 \end{bmatrix} \qquad \qquad R = \begin{bmatrix} r_1 & \cdots & r_6 \end{bmatrix}$$

$$Span\{a_1, \cdots, a_6\}$$
  $Span\{r_1, \cdots, r_6\}$ 

Are they the same?

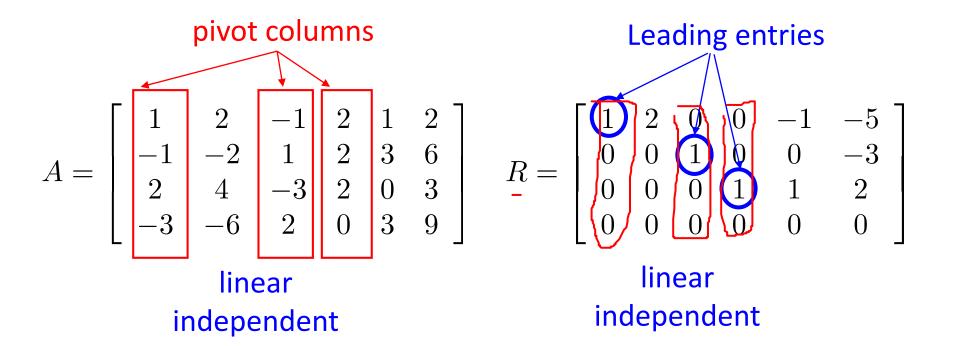

The elementary row operations change the span of columns.

#### NOTE

- Original Matrix v.s. RREF
  - Columns:
    - The relations between the columns are the same.
    - The span of the columns are different.
  - Rows:
    - The relations between the rows are changed.
    - The span of the rows are the same.

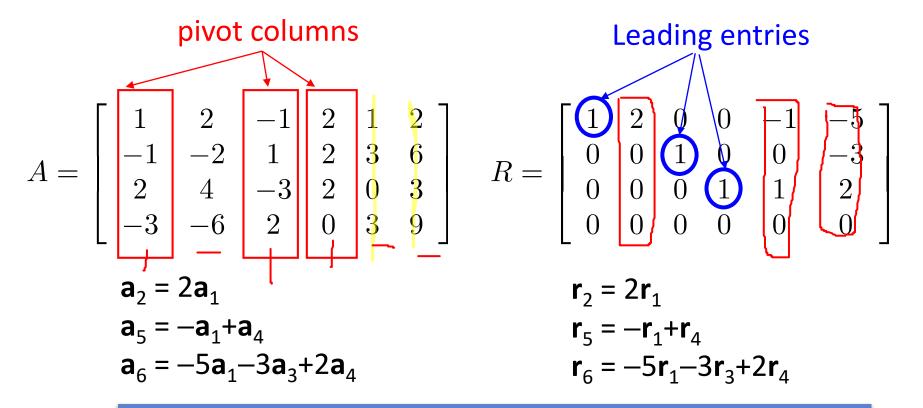

#### RREF v.s. Independent

#### Column Correspondence Theorem

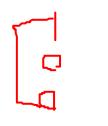

The pivot columns are linear independent.

#### Column Correspondence Theorem

The non-pivot columns are the linear combination of the previous pivot columns.

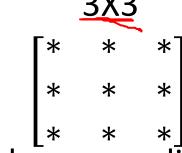

All columns are independent

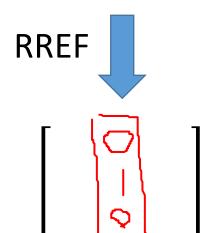

Every column is a pivot column

Every column in RREF(A) is standard vector.

Columns are linear independent

Identity matrix

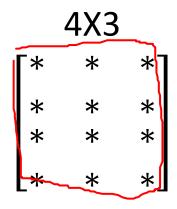

All columns are independent

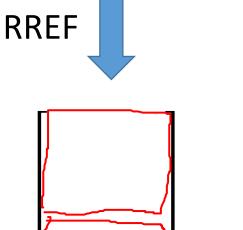

Every column is a pivot column

Every column in RREF(A) is standard vector.

Columns are linear independent

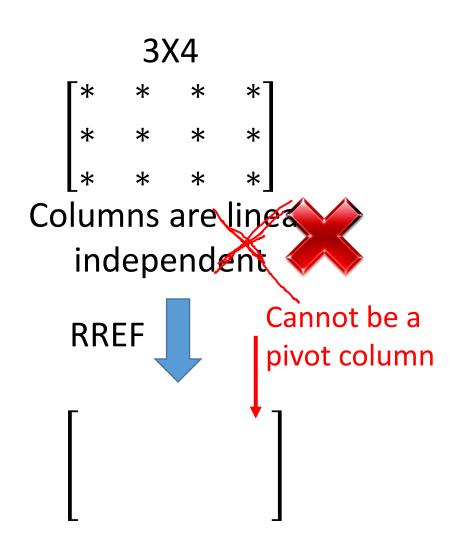

All columns are independent

Every column is a pivot column

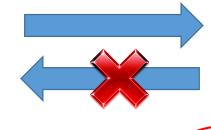

Every column in RREF(A) is standard vector.

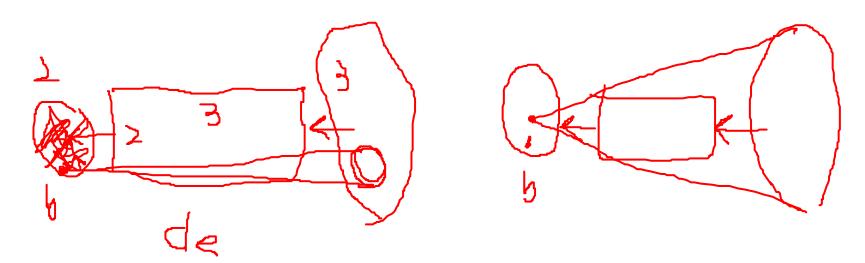

The columns are dependent

$$\mathcal{S} = \left\{ \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ 4 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ 2 \\ 3 \end{bmatrix} \right\}$$
 Dependent or Independent?

More than 3 vectors in R<sup>3</sup> must be dependent.

More than m vectors in R<sup>m</sup> must be dependent.

#### Independent – Intuition

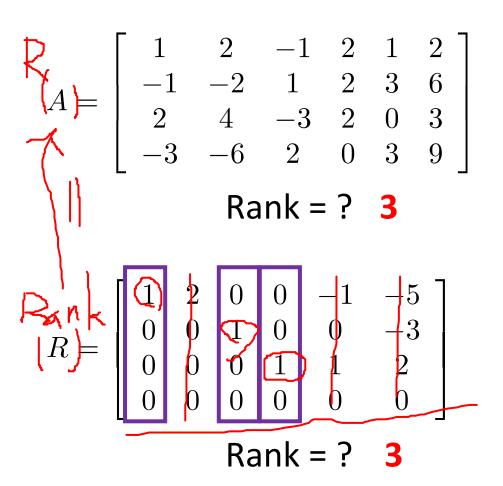

#### RREF v.s. Rank

#### Rank

Maximum number of Independent Columns

Number of Pivot Column

Number of Non-zero rows

#### Properties of Rank from RREF

Maximum number of Independent Columns

Rank A ≤ Number of columns

Ш

Number of Pivot Column

Number of Non-zero rows

Rank A ≤ Min( Number of columns, Number of rows)

Rank A ≤ Number of rows

#### Properties of Rank from RREF

- Given a mxn matrix A:
  - Rank  $A \leq \min(m, n)$

Matrix A is <u>full rank</u> if Rank A = min(m,n)

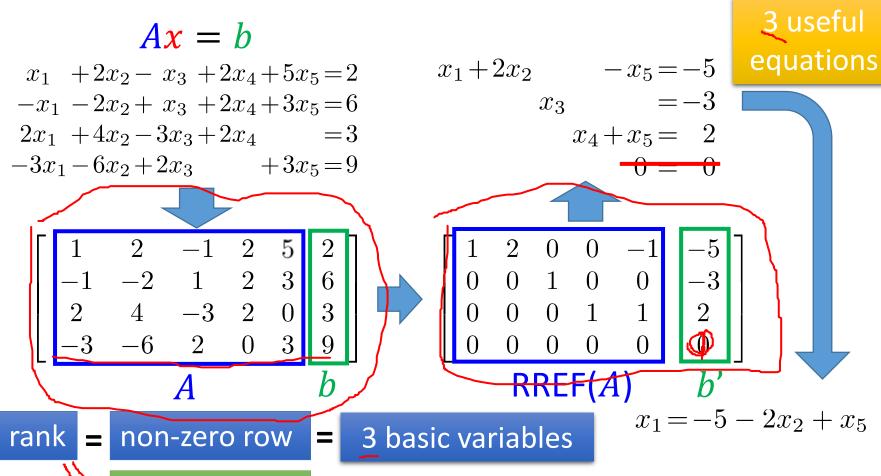

- Because "the columns of A are independent" is equivalent to "rank A = n"
  - If m < n, the columns of A is dependent.

$$\left\{ \begin{bmatrix} * \\ * \\ * \end{bmatrix}, \begin{bmatrix} * \\ * \\ * \end{bmatrix}, \begin{bmatrix} * \\ * \\ * \end{bmatrix}, \begin{bmatrix} * \\ * \\ * \end{bmatrix} \right\}$$

A matrix set has 4 vectors belonging to R<sup>3</sup> is dependent

• In R<sup>m</sup>, you cannot find more than m vectors that are independent.

#### Basic, Free Variables v.s. Rank

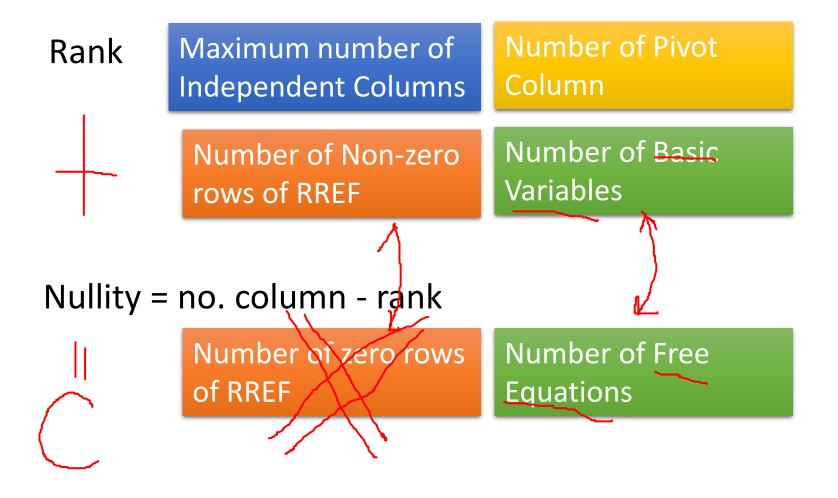

nullity No. column – non-zero row

2 free variables

 $x_3 = -3$   $x_4 = 2 - x_5$ 

#### Rank

### RREF v.s. Span

#### Consistent or not

 Given Ax=b, if the reduced row echelon form of [ A b]is

the columns of A

Given Ax=b, if the reduced row echelon form of [ A

**b** ] is

$$\begin{bmatrix} 1 & 0 & 3 & 0 \\ 0 & 1 & 2 & 0 \\ \hline 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

b is NOT in the span of the columns of A

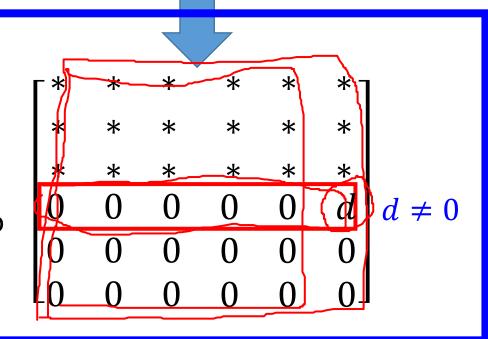

$$0 \cdot x_1 + 0 \cdot x_2 + 0 \cdot x_3 = 1$$

#### Consistent or not

Ax =b is inconsistent (no solution)

The RREF of [A b] is

Only the last column is non-zero

Rank  $A \neq rank [A b]$ 

Need to know b

#### Consistent or not

Ax =b is consistent for **every** b

RREF of [A b] cannot have a row whose only non-zero entry is at the last column

RREF of A cannot have zero row

Rank A = no. of rows

3 independent columns

Ax =b'is consistent for *every* b

Rank A = no. of rows

Every b is in the span of the columns of

$$A = \begin{bmatrix} a_1 & \cdots & a_n \end{bmatrix}$$

Every b belongs to 
$$Span\{a_1, \dots, a_n\} = R^m$$

m independent vectors can span  $R^m$ 

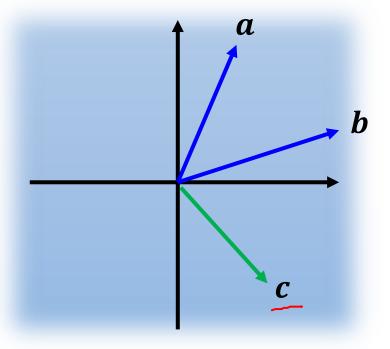

More than m vectors in R<sup>m</sup> must be dependent.

## m independent vectors can span $R^m$

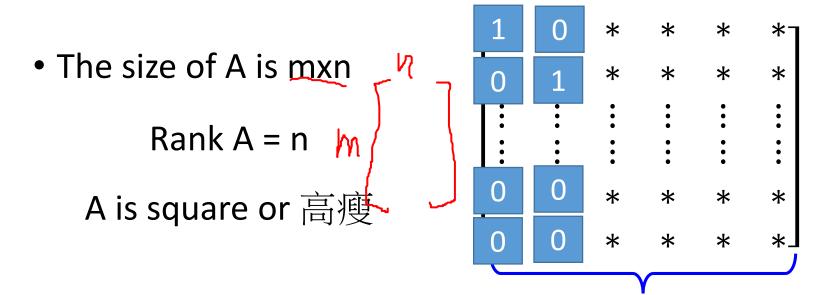

More than m vectors in R<sup>m</sup> must be dependent.

• Consider R<sup>2</sup>

Does 
$$S = \left\{ \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ -2 \\ 1 \end{bmatrix} \right\}$$
 generate  $\mathcal{R}^3$ ? yes

#### Full Rank: Rank = n & Rank = m

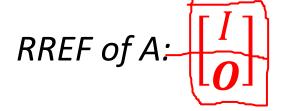

Ax = b has at most one solution

The columns of *A* are linearly independent.

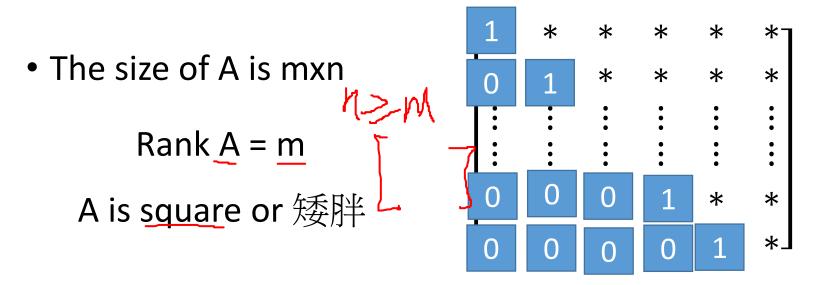

All columns are pivot columns.

#### Full Rank: Rank = n & Rank = m

Every row of R contains a pivot position (leading entry).

 $A\mathbf{x} = \mathbf{b}$  always have solution (at least one solution) for every  $\mathbf{b}$  in  $\mathcal{R}^m$ .

The columns of A generate  $\Re^m$ .
