Task Introduction

Task Introduction

1. Data Preprocessing: Extract MFCC features from raw waveform (already done by TAs!)
2. Classification: Perform framewise phoneme classification using pre-extracted MFCC features

Task Introduction

Task: Multiclass Classification

Frame-wise phoneme prediction from speech.

What is a phoneme?

A unit of speech sound in a language that can serve to distinguish one word from the other.

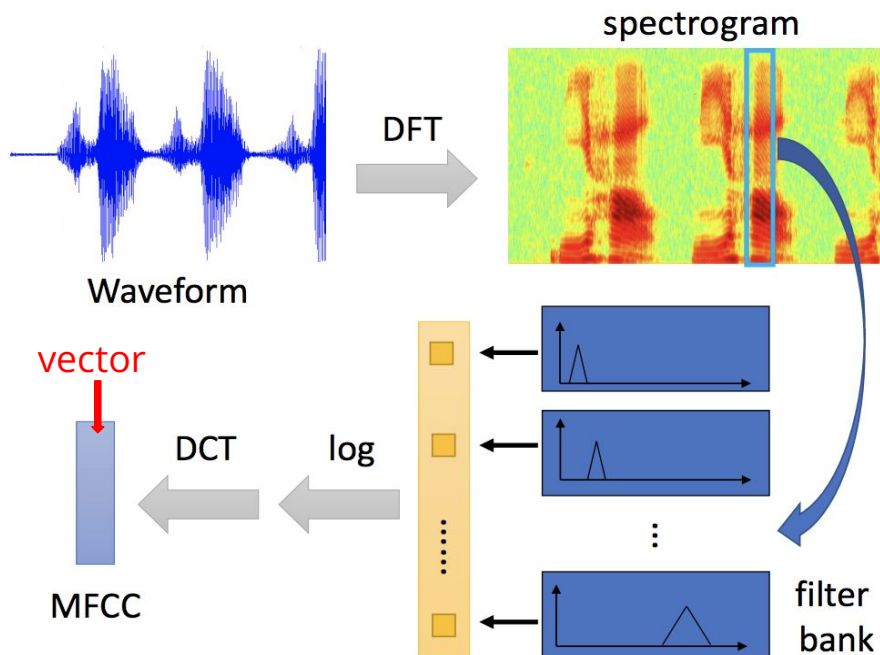

- bat / pat , bad / bed
- Machine Learning → M AH SH IH N L ER N IH NG

Data Preprocessing

Data Preprocessing

More Information About the Data

Since each frame only contains 25 ms of speech, a single frame is unlikely to represent a complete phoneme

- Usually, a phoneme will span several frames
- Concatenate the neighboring phonemes for training

Finding testing labels or doing human labeling are strictly prohibited!

Dataset & Data Format

Dataset

LibriSpeech (subset of train-clean-100)

- Training: 4268 preprocessed audio features with labels (total 2644158 frames)
- Testing: 1078 preprocessed audio features (total 646268 frames)
- Label: 41 classes, each class represents a phoneme

Q1

2 Points

Implement 2 models with approximately the same number of parameters, (A) one narrower and deeper (e.g. hidden_layers=6, hidden_dim=1024) and (B) the other wider and shallower (e.g. hidden_layers=2, hidden_dim=1700). Briefly discuss the difference in training processes and training/validation accuracies.
